This information is for patients who are having a flexible sigmoidoscopy and a gastroscopy. It tells you what is involved with these tests and any significant risks which may occur. The tests will last about 45 minutes and you will normally be able to go home approximately 2 hours later.

Patients Frequently Asked Questions

What is a gastroscopy?

It is an examination of your oesophagus (gullet), stomach and duodenum (the first bend of the small intestine). A thin, flexible tube (gastroscope) is passed through your mouth into your stomach. This allows the endoscopist to see what might be causing your symptoms.

What is a flexible sigmoidoscopy?

A flexible sigmoidoscopy is the name given to the examination of the lower part of the left side of your large bowel (colon) using a flexible tube passed into your back passage (anus). The flexible tube, once in position, will give the doctor clear detailed images of your bowel.

What will the examinations involve?

- The endoscopist doing the examinations will discuss both with you and ask you to sign a consent form confirming that you understand and agree to go ahead with it. You are free to ask for more information at any time.

- You will need to undress and wear a hospital gown along with a dressing gown. You will be offered disposable shorts to wear.
You will lie on your left hand side for both procedures. You may be offered
sedation and Entonox (gas and air). The gastroscopy will be performed by the
endoscopist who will insert the gastroscope through your mouth and into your
stomach. This is not painful and will not make breathing or swallowing
difficult but you may feel a little uncomfortable during the test.

You will also have a flexible sigmoidoscopy where the endoscopist will gently
insert the endoscope into your anus and up into the bowel. This test may
cause some discomfort due to the bowel being gently inflated to expand it so
that the lining can be seen clearly. We now use carbon dioxide (C0₂) instead of
air to do this, and this has proved to be much more comfortable.

A biopsy (a small sample of the bowel lining) may be taken during the
procedures to be sent off to the laboratory for further testing. This will not cause
you any pain.

The nurse will be with you during your test.

How do I prepare for the tests?

If you are diabetic or on Warfarin / Clopidogrel please inform the Endoscopy
Unit on (01803) 654864 / 655955.

It is important for these tests that both your stomach and bowel are empty. In order to
achieve this please read and follow the instructions below:

Two sachets of Picolax powder are enclosed. Please follow our advice carefully in
order to ensure an empty bowel, this will allow a complete examination. When taking
this preparation some intestinal cramping is normal. If you feel clammy and faint or if
you vomit please take no more preparation and phone the Endoscopy Unit helpline on
(01803) 654863 or your own GP for advice.

5 days before gastroscopy and flexible sigmoidoscopy

Stop taking any iron tablets or medications to control diarrhoea. You should continue
to take any other medication.

3 days before gastroscopy and flexible sigmoidoscopy

Following the advice on the reverse of this form, continue to eat but avoid high-fibre
foods and choose low-fibre alternatives.

2 days before gastroscopy and flexible sigmoidoscopy

Continue your low-fibre diet. Drink plenty of fluids.

1 day before gastroscopy and flexible sigmoidoscopy

For morning appointments: Take the first sachet of Picolax at 8am and the
second at 4pm.

For afternoon appointments: Take the first sachet of Picolax at 4pm (you will
take your second sachet tomorrow morning).
Stir the contents of the sachet into a cup or glass of cold water. Once dissolved, drink, followed by a litre of clear fluid over the next 2 hours. Following this you will experience a period of frequent bowel actions and diarrhoea. You may find that applying a small amount of Vaseline / Sudocreme to your back passage (anus), prevents discomfort during the bowel preparation.

**Stop** all solid food **24 hours** prior to your appointment time. For example, if your appointment is at 10.30am stop eating at 10.30 am today.

It is essential that you drink plenty of fluids to avoid becoming dehydrated, right up until 2 hours before your appointment time.

**The day of your gastroscopy and flexible sigmoidoscopy**

For **afternoon** appointments: **Take the second sachet of Picolax at 8am.**

**Please continue to drink plenty of water / clear sugary drinks (lemonade, etc) until 2 hours before your appointment time.**

**Suitable clear fluids**

What will happen when I arrive?

An endoscopy nurse will care for you from your arrival through to your discharge from the Unit. The nurse will explain the test to you and check your details including blood pressure and pulse.

Jewellery and decorative piercing should ideally be removed. If you cannot remove your jewellery, it can be covered with tape, but please inform us when you see the nurse on the day of your procedure. Please inform us also of any coloured tattoos.

What happens after the examination?

- You will be able to get dressed straight after the test.
- Your nurse will speak to you after the test but biopsy results will be reviewed within a few days. Please call your surgery for your results in approximately 3 weeks.
- You will be offered some refreshment and be discharged home as soon as you are ready to go.
- You will be given a copy of your report, which we will also send on to your GP.

How will I feel when I go home?

- You may have some abdominal discomfort for the rest of the day, in the form of wind, bloating and maybe a little bleeding but this will pass.
- You may have a mild sore throat, this will soon pass and is nothing to worry about.
- You may eat and drink as normal when you leave the unit.
About sedation

A small plastic tube (cannula) will be placed in a vein in your arm in order to give you a sedative and a painkiller. This will be done just before the test starts.

Benefits

You will feel relaxed during the test and may or may not remember much about it.

Drawbacks

Sedation takes up to 24 hours to wear off and during this time you are not safe to:
- Drive a vehicle or operate machinery
- Drink alcohol
- Sign legal documents or make important decisions

It is not suitable for everybody as it can have adverse effects. It is very important that you are not alone during the 12 hour recovery period, and that you do not use public transport, but are collected from the unit.

Are there any risks?

These examinations are very safe, however, there is a small risk of:

Flexible sigmoidoscopy

Perforation: Which is a small tear in the bowel (1 in 1000 risk).

Gastroscopy

- Damage to dental bridgework, loose or crowned teeth.
- Perforation: This is a tiny tear in the gullet or stomach which could need repair by surgery (the risk is less than 1 in 1000).
- Bleeding: A small amount of bleeding happens rarely following biopsy.

Please speak to the endoscopist before the examination if you have any worries about these risks.

Useful contacts

If you have any further questions or concerns, please contact:
The Endoscopy Unit
☎ Tel (01803) 654864/655955
(8.00am - 5.00 pm, Monday to Friday)

If you have any urgent concerns outside of these hours
please phone the switchboard
☎ Tel (01803) 614567
and ask for bleep no 110
