

PATIENT INFORMATION

Flow Rate Investigation

You have been booked for a flow rate test with a urology nurse.

The following advice is intended to give you as much information as possible. Please allow up to 4hrs for this appointment. Your appointment will be as long as the time you need to fill your bladder and pass the adequate amount of urine. Please see below for further information.

HOW SHOULD I PREPARE FOR THE INVESTIGATION?

With your appointment letter you will have been sent a 'Frequency and Volume Chart' to complete. This is a 3 day diary of what fluid you have drunk, at what time of day, when you have passed urine and the volume of urine passed. You will need a measuring jug or device to record the volumes of urine you pass. If you have not received this please contact the Urology secretary on 01803 656204.

Ensure you are well hydrated the day before and the day of your investigation. A volume of 4-5pints of fluid is recommended per day.

On the day you will need to fill your bladder with approximately 600mls of fluids and bring a drinking device (water bottle etc) with you for your appointment.

WHAT HAPPENS DURING THE INVESTIGATION?

On arrival at the clinic details about your symptoms and medications you may be taking will be asked. You will then be asked to sit in the waiting area.

When your bladder is comfortably full, you will be asked to pass water into a special machine in the manner that you normally pass urine at home by sitting or standing. This will take place privately in the clinic room. The machine will measure and time your urinary flow rate.

In order for the flow machine to gather the information you need to pass a minimum of 150mls of urine. If this is unsuccessful on the first attempt you will be required to re-fill your bladder and take the test again

After passing urine the nurse will scan your bladder with a hand held scanner to see if it is empty.
