

PATIENT INFORMATION

Stretches for Tight Soleus Muscles

Our assessment has shown that the soleus muscle in one or both of your lower legs is tight, and may be contributing to any foot, ankle or lower limb pain that you may be experiencing.

It is important to reduce this tightness, and so we have asked you to perform regular stretching exercises to achieve this.

Steps to stretch the soleus muscle:

1. Find a flat wall with a clear floor area.
2. Place the palms of your hands flat against the wall, at approximately shoulder height and about a shoulder width apart.
3. Place both foot approximately one foot's length from the wall, with the toes of both feet pointing at the wall.
4. Now move one leg back, keeping the toes pointing at the wall.
5. SLOWLY, lean in towards the wall, keeping both knees bent as shown in the diagram.

**KEEP BOTH HEELS ON THE GROUND
AT ALL TIMES.**

You should start to feel tightness in the back leg. If you do not, repeat from step 4, but move the back leg slightly further from the wall.

6. Hold this position for 30 seconds
DO NOT BOUNCE TOWARDS THE WALL TO INCREASE THE STRETCH,
AS THIS MAY CAUSE FURTHER INJURY.
7. Repeat for the other leg.
8. Then repeat the whole process once more, stretching both legs.

THE ABOVE PROCESS SHOULD BE REPEATED 3 TIMES EVERY DAY.
